1. Game Overview

1.1 Summary

War on Water is a top-down auto-shooter survival game in the tradition of Vampire Survivors, designed for sessions of 5-10 minutes. The player controls Logi (Norse God, personification of fire), a fire elemental warrior dispatched by the ancient fire deity Vulcan (named after Roman God responsible for volcanoes) to halt the rise of the Cthullu: a water-elemental God threatening to extinguish all flame from the world. To reach this final enemy, Logi must carve through relentless waves of water monsters, growing more powerful with every level gained.

The player experience (PX) goal is exhilarating escalation: every run feels like a wildfire, starting small and spreading into a spectacular blaze of destruction. Players are rewarded for surviving under pressure, making smart upgrade choices, and mastering movement to avoid damage, all while the screen fills with increasing enemy hordes and fire effects. Success feels earned; failure feels instructive enough to send the player straight back in for another run.

1.2 High-Level Concept

Goal

Survive long enough to reach and defeat Cthullu before being overwhelmed by water enemies.

What the Player Does

- Navigate: Logi across the arena using movement controls (WASD / controller stick).
- Logi fires automatically toward the nearest enemy, the player focuses entirely on movement and positioning.
- Collect XP orbs dropped by slain enemies to level up.
- On each level-up, choose one of three randomly offered ability upgrades offered by Vulcan.
- Survive all waves and then defeat Cthullu to win the run.

Core Challenges

- **Enemy density:** water hordes grow in number and speed over time.
- **Upgrade decisions:** three cards are offered; picking the right synergy is crucial.
- **Positioning:** the arena has no safe corner; constant movement is required.

- **Boss phases:** Cthullu changes attack patterns at HP thresholds, demanding adaptation.

Setting

War on Water is set in a sandy volcanic island filled with rock pools, water and lava rivers. This is to create a fitting environment for a war against water / oceanic enemies while still supporting the player character's ability to fight in the environment.

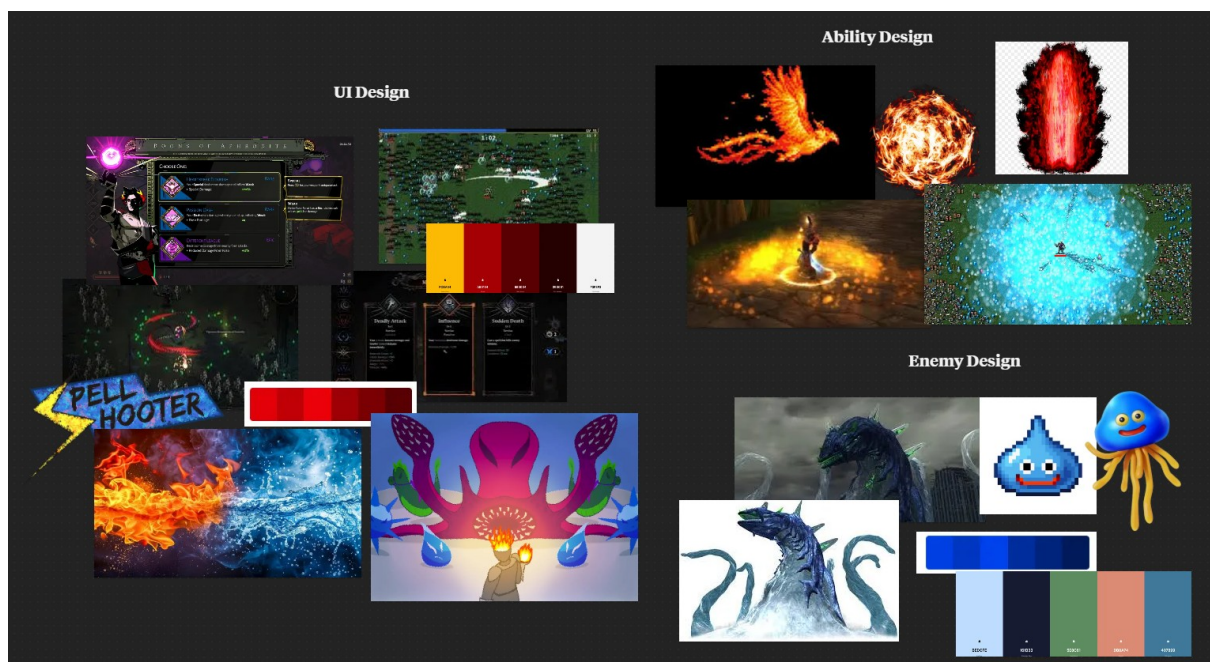

1.4 Look & Feel / Mood Board

War on Water is to be designed in pixel art (retro 16-bit aesthetic with particle effects). This will keep it close to the genre game (Vampire Survivors) as well as make it easy to distinguish sprites.

The game uses vibrant and high contrast colour palettes to improve gameplay readability, ensuring characters, hazards and enemies are immediately indistinguishable.

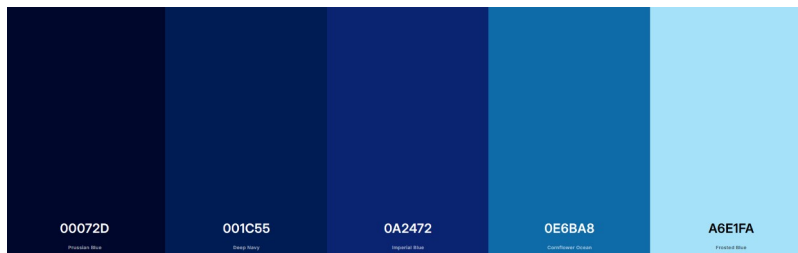

Mood Board:

Mood images split into visually distinct categories to not confuse inspiration and colour palettes for the different aspects of design.

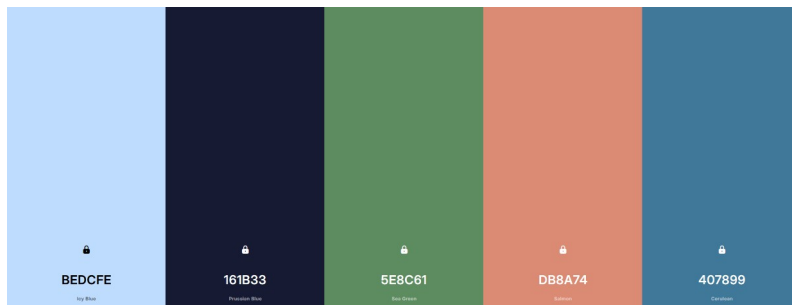

Colour Palettes:

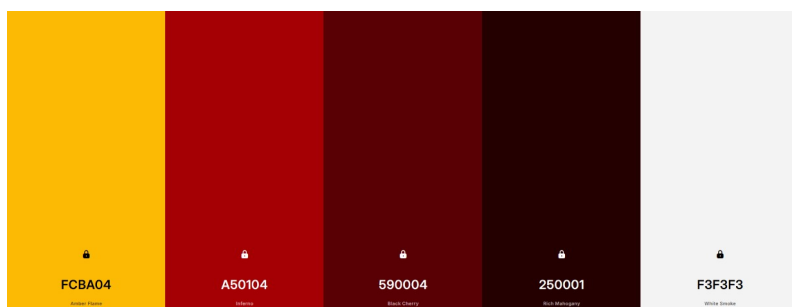

Water:

Enemies:

Fire / Lava:

Background:

1.5 Game Concept Statement

War on Water is a single-player top-down survivor game in which a fire elemental hero battles through escalating hordes of water enemies, guided and empowered by an ancient fire deity, to defeat the God Cthullu and save the world from an eternal flood.

Justification for Revisions

- Upgrade system as "choose 1 of 3 random cards" (Vampire Survivors model) based on group discussion
- Cycle 3 elemental allies (earth, wind, lightning) noted but explicitly scoped out of Cycle 2 to keep the core loop achievable.

2. Gameplay and Core Mechanics

2.1 Objectives

The overarching goal is to defeat the God Cthullu. This is achieved through the following implementation steps:

- *Survive each timed enemy wave without dying.*
- *Accumulate XP by killing enemies, triggering level-ups that strengthen Logi.*
- *Build an effective ability synergy through smart upgrade card selection.*
- *Reach and complete the boss encounter at the end of Wave 10.*

2.2 Core Challenges & How Players Overcome Them

Challenge 1: Enemy Density

Water minions spawn in exponentially increasing numbers as each wave progresses. Players overcome this through constant movement (kiting), positioning Logi to maximise area-of-effect ability coverage, and prioritising high-density clusters.

Challenge 2: Upgrade Synergy

Three random upgrade cards are presented on each level-up. Players must quickly evaluate which card best synergises with their current build. No card is strictly "correct" or "meta", trade-offs and build diversity are intentional. Logi provides brief flavour text hinting at each card's value.

Challenge 3: Boss Phases

Cthullu cycles through three attack phases. Each phase introduces new projectile patterns or arena hazards. Players must adapt their movement and positioning mid-fight, rewarding attention to enemy telegraphing.

Challenge 4: Resource Management

Health orbs are the only healing source during a wave. Players must decide when it is safe to path toward a health orb versus continuing to dodge, creating constant micro-decisions.

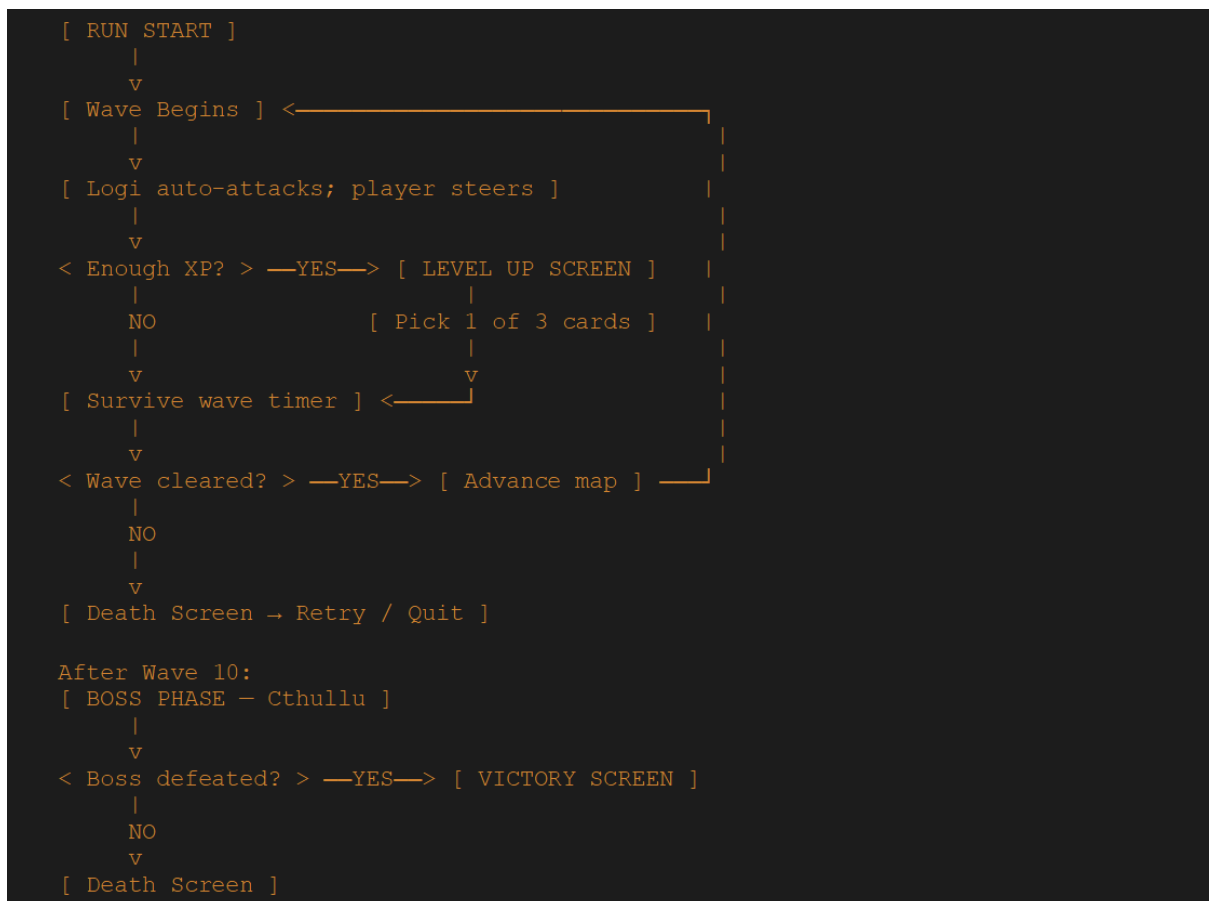

2.3 Rewards & Penalties

<i>Player Behaviour</i>	<i>Reward</i>	<i>Penalty</i>
<i>Killing enemies</i>	<i>XP, occasional health orbs</i>	<i>XP drops near enemy groups, risk taking damage to collect</i>
<i>Taking damage</i>	<i>None</i>	<i>Health reduction; death = game over</i>
<i>Levelling up</i>	<i>Choose 1 of 3 ability upgrades</i>	
<i>Surviving wave timer</i>	<i>Wave cleared; map advances</i>	<i>Harder next wave on failure</i>
<i>Collecting health orbs</i>	<i>HP restored up to maximum</i>	<i>None (lost if not picked up)</i>
<i>Standing in water zones</i>	<i>None</i>	<i>Ongoing damage-over-time debuff</i>

2.4 Gameplay Flow & Progression

The run is structured as a sequence of 10 timed waves followed by a boss encounter. Difficulty scales by increasing enemy HP, movement speed, and spawn rate each wave. The player's power also scales via level-up upgrades, creating an intended arms race.

Flow Diagram

Wave Structure

1-3	Waves	Tutorial density; single enemy type (Water Sprite). Teach movement fundamentals.
4-6	Waves	Second enemy type introduced (slower but higher HP). First elite spawn.
7-9	Waves	Third enemy type (fast, low HP, swarm behaviour). Double elite spawns.
10	Wave	Boss Wave: all minion spawning halted; Boss activates.

2.5 Ability Upgrades

On level-up, Logi appears and presents 3 randomly selected cards from the upgrade pool. Each card either unlocks a new ability (if not already held) or upgrades an existing one (up to 2 upgrade tiers per ability). The player selects one card; time is paused during selection.

Ability	Base	Upgrade	Upgrade
---------	------	---------	---------

	Effect	1	2
Ember Shot	Fires a fireball every 1.5 s	+20 % damage, -0.2 s cooldown	Pierces through 1 extra enemy
Fire Ring	Radial burst every 5 s around Logi	Larger radius, +15 % damage	Leaves a burning ground patch
Flame Trail	Logi leaves fire on the ground briefly	Trail lasts 2× longer	+30 % burn damage per tick
Cinder Aura	Passive: damages nearby enemies	+25 % aura radius	Applies stacking burn debuff
Magma Orb	Orbiting projectile (1 orb)	+ 1 additional orb	Orbs explode on enemy contact
Heat Wave	Cone blast forward on cooldown	Wider cone angle	Stuns enemies hit for 0.5 s
Heat Intensity	Increase damage 10%	Increase damage 20%	Increase damage 30%
Heat Dissipation	Decrease skill CDs 10%	Decrease skill CDs 20%	Decrease skill CDs 30%

2.6 Objects, Attributes & Interactions

Object	Key Attributes	Player Interaction	Rules / Effects

Logi (Player)	HP, move speed, fire damage, area, cooldowns	Moves with WASD/joystick; attacks auto-fire	Dies at 0 HP; levels up on XP threshold
Water Droplet / slime	HP, speed, contact damage, XP value, combine with other slimes and increase HP, size, contact damage	Avoid or destroy; they pursue Logi	On death: drop XP orbs; chance to drop health orb
Water Knights	Higher HP, ranged water bolts, unique patterns	Must be actively dodged and burst down	Appear every 5 minutes; drop bonus XP

Water Golems	HP, speed (slower than slime), contact damage, XP value	Avoid or destroy; they pursue Logi	On death: drop XP orbs; chance to drop health orb
-----------------	--	--	--

Anti Sub Bombs	HP (tank), speed (slow), contact damage, XP value, timer (explodes when timer = 0)	Avoid or destroy; they pursue Logi	On death: drop XP orbs, Deals AOE damage (explodes)
Cthullu Boss (Final)	Huge HP pool, multiple attack phases	Survive phases; deal sustained DPS	Phase shifts at 75 %, 50 %, 25 % HP
XP Orbs	Value (small / medium / large)	Walk over to collect automatically	Accumulate toward next level threshold
Health Orbs	Flat HP restore amount	Walk over to collect automatically	Cannot exceed max HP; despawn after 15 s
	3		

Upgrade Cards	cards offered; each shows icon + description	Player selects one card to apply	Remainder discarded; time pauses during selection
Vulcan (NPC)	Dialogue trigger, upgrade giver	Passive; appears on level-up screen	Narrates the 3 offered upgrades; flavour text
Water Hazard Zones	Damage-per- second value, duration	Avoid by repositioning	Triggered by elite/boss abilities; visible as blue AOE

2.7 Rules, Events & Effects Summary

Core Rules

- *Logi attacks automatically every frame; player input is movement only.*
- *XP orbs have a small magnetic pull-radius; the player does not need to be directly on top.*
- *The arena is bounded: Logi cannot leave the playfield.*
- *Time pauses during the upgrade card selection screen.*
- *A run ends immediately on Logi reaching 0 HP.*

Key Events

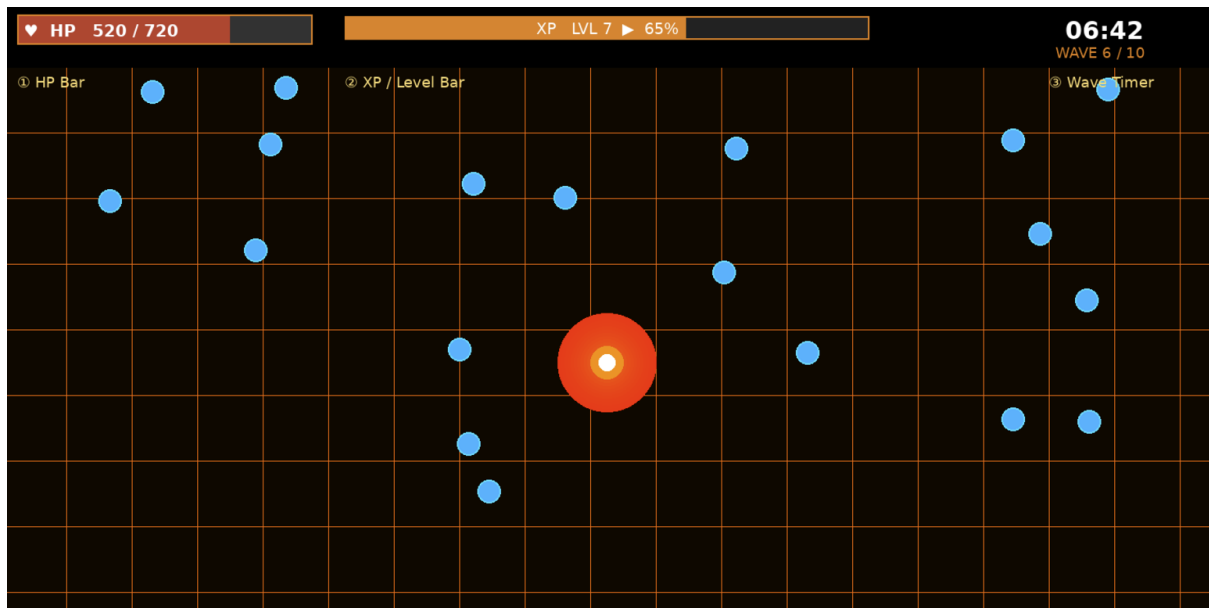

- **Wave Start:** *Enemy spawners activate around the arena perimeter.*
- **Elite Spawn (every 5 min):** *A named Elite enemy with unique visual FX appears with a brief warning indicator.*
- **Level-Up:** *XP bar fills → Vulcan cutaway → 3-card upgrade screen.*
- **Boss Spawn:** *Wave 10 clears minions, Cthullu emerges with a dramatic entrance cutscene.*

Screen Inventory

- **Main Menu:** Entry point. Buttons: Start Game, Settings, How To Play. Static title card for Cycle 2.
- **Settings:** Audio sliders (Master / SFX / Music).
- **How To Play:** Single scrollable help screen. Accessible from Main Menu before any run.
- **Wave Gameplay:** Core game loop. HUD always visible. ESC to pause.
- **Level-Up Screen:** Time-paused overlay. Logi speaks; player picks 1 of 3 upgrade cards.
- **Wave Cleared:** Auto-advancing interstitial (2-3 s) showing wave kills and XP gained.
- **Next Wave Prep:** 3-second countdown overlay before next wave begins.
- **Boss Encounter:** Same arena; boss HP bar replaces wave timer; no minion spawning.
- **Victory Screen:** Run stats (time, kills, level, abilities) + Return to Main Menu button.
- **Death Screen:** Cause-of-death text + Retry / Return to Main Menu buttons.

3.2 In-Game HUD Design

The HUD is minimal; All elements live at the screen edges to keep the central arena fully visible. The annotated mockup below shows all HUD components at a representative mid-run state (Wave 6, Level 7).

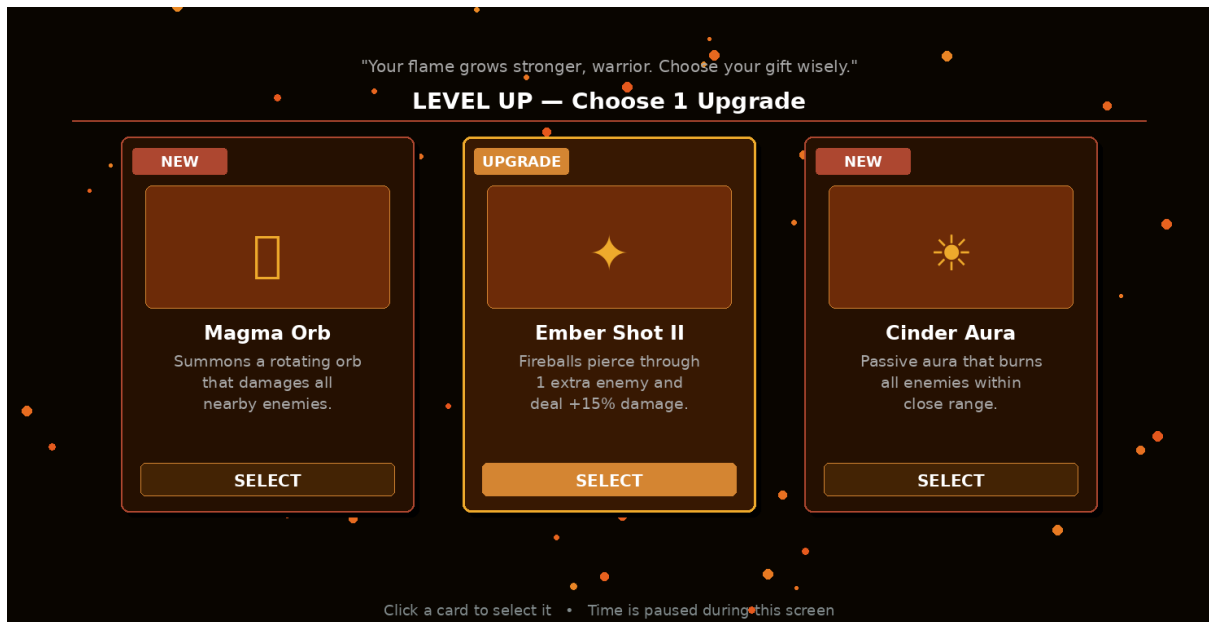

HUD Element Descriptions

- ① **HP Bar (top-left)**: Red fill bar. Numeric fraction displayed. White flash on damage. Pulses red when HP is below 25%.
- ② **XP / Level Bar (top-centre)**: Orange gradient fill tracking XP progress. Level number inline. Flash animation triggers on level-up.
- ③ **WaveTimer (top-right)**: MM:SS countdown to wave end. Wave number below ("WAVE 6 / 10"). Turns red at under 30 seconds.

3.3 Level-Up Screen Design

When Logi levels up, time pauses and the Level-Up Screen overlays the arena. Logi delivers a brief line of flavour text, then three upgrade cards appear. The player clicks one to apply the upgrade and resume gameplay.

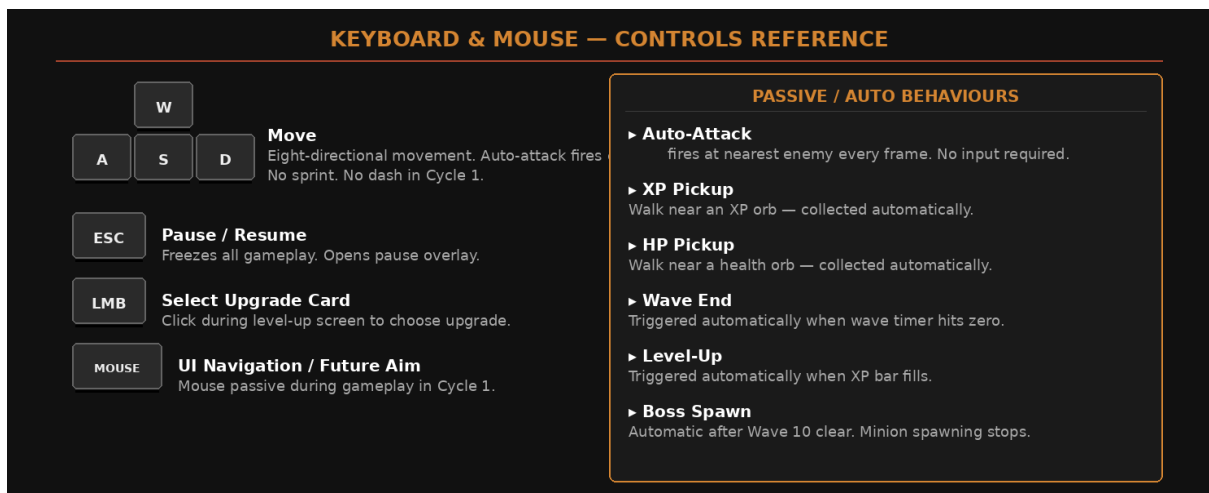

Card Anatomy

- **Tier Badge (top-left of card):** "NEW" in red = ability not yet owned. "UPGRADE" in orange = ability already held, next tier unlocked.
- **Icon Area:** Illustrative ability icon. Placeholder coloured icons acceptable for Cycle 2; final art in Cycle 3.
- **Ability Name:** Bold white text, always legible against the dark card background.
- **Description:** 2-3 plain English lines describing the effect.
- **Select Button:** Highlighted amber on the centre card by default. Player can click any of the three.

3.4 Control System: Keyboard & Mouse

War On Water uses a minimal control scheme for Cycle 2. The player never needs to hold more than one key for core gameplay. The mouse is used only for UI interaction (upgrade cards, menu buttons).

Full Control Reference

Input	Action	Detail
W / A / S / D	Move Logi	Eight-directional. Diagonal vectors normalised.
Mouse Move	UI Navigation	Passive during gameplay in Cycle 2. Reserved for Cycle 3 aimed abilities.
Left Click	Select Upgrade Card	Used on the Level-Up Screen to choose one of three upgrade cards.
Left Click	Button Press	All menus: Start Game, Retry, Settings sliders, back buttons.
ESC	Pause / Resume	Toggles pause overlay. Time.timeScale = 0 while paused.
ESC (in menus)	Back	Returns to previous screen or closes current overlay.

3.5 Game Help System

War On Water uses a "How To Play" screen accessible from the Main Menu rather than an in-game tutorial overlay. This is appropriate for the survivors-like genre: players expect to learn by doing, and intrusive prompts would interrupt the fast-paced loop. The control scheme is simple enough that a single pre-run help screen is sufficient.

How To Play Screen: Required Content

- Objective: "Survive the waves and defeat the God Cthullu."

- *Movement: WASD keyboard diagram illustration with directional arrows.*
- *Combat: "Logi attacks automatically: focus entirely on movement."*
- *Levelling: "Collect XP orbs from defeated enemies. Level up to choose an upgrade."*
- *Health: "Collect health orbs to restore HP. Your run ends if HP reaches zero."*
- *Boss: "Reach Wave 10 to trigger the final boss encounter."*

In-Game Contextual Help (First Run Only)

- *Run start: one-line tooltip at screen centre for 4 seconds: "Use WASD to move. Ignis attacks automatically." Stored as seen in Unity PlayerPrefs; does not repeat on subsequent runs.*
- *First level-up: brief arrow tooltip pointing at the card screen: "Click a card to choose your upgrade." Same PlayerPrefs one-shot pattern.*

3.6 Audio Design

Audio is crucial to communicating important gameplay events, and reinforcing positive and negative player actions, moments such as, player taking damage, levelling up, and xp gain. Smart audio design choices will allow the player to interpret what is going on easier during high intensity moments. The audio was designed according to the player experience goal of exhilarating escalation. This escalation is made naturally, as more enemies spawn, and abilities become quicker and more powerful, resulting in audio clips being played more as gameplay continues.

A key consideration taken when designing audio was to manage repetition and audio clutter. Most abilities are paired with distinct audios, crackling, whooshing, and burning sound effects give each of the abilities its own identities. This is especially important when designing a "Vampire Survivors" like game, where audios are triggered constantly by abilities, conditions and music. The most frequent audios like ember shot, and enemy hit, were managed by choosing quick, less overwhelming audios. This allowed clear feedback for the player, while preventing audio fatigue through long playthroughs. Frequently triggered audios, also contain a random pitch variance. Pitch variance allows for each ability to have its own unique identity, while reducing audio fatigue and maintaining clear feedback. Other specific audios such as, xp pickup, have audios that incrementally increase the pitch if the player picks multiple xp orbs in a row. Intentional audio design choices like this increase add to the player experience, in this case, it increases satisfaction.

4.0 Game Design Review and Reflection

4.1 What worked well?

Two key aspects of the design strongly supported the intended player experience of exhilarating escalation.

First, the upgrade card system effectively reinforced player progression and build diversity. The “choose 1 of 3” structure created meaningful decision-making moments, encouraging players to actively evaluate synergies rather than passively receiving upgrades. This allowed the player to stack up to nine abilities (each with upgrade tiers) to give players a clear sense of increasing power. This supported the escalation goal, as players visibly transitioned from weak to highly destructive over the course of a run.

Second, the wave-based enemy progression successfully created intensity spikes, shaping player behaviour over time. The introduction of new enemy types and increased spawn density; particularly at Wave 5; produced moments of sudden chaos to force tighter positioning and rapid decision making due to increased enemy density. While still balanced for a prototype, this shift in pressure aligned with the intended feeling of the game “ramping up,” reinforcing tension and engagement.

Aspect	Why it worked
Upgrade card system	Created meaningful choices and strong sense of progression; reinforced escalation through stacking abilities
Wave progression	Increasing enemy density and new enemy types created intensity spikes and maintained engagement

4.2 Where was there room for improvement?

One major issue was early-game pacing. Initial enemy HP values were too high, resulting in slow combat and reduced engagement. This conflicted with the intended fast escalation, leading to adjustments that lowered enemy durability and improved pacing. This highlighted the importance of aligning time-to-kill with desired player intensity, to encourage more active movement and risk-taking.

Another issue was ability balance and feedback clarity. Certain abilities (e.g., Cinder Aura, Fire Ring) trivialised gameplay due to excessive area of effect and damage, while others (e.g., damage-scaling upgrades (Infernal Focus, Magma Orb) felt underwhelming. Iterative tuning improved both extremes, reinforcing the lesson that player experience depends not just on mechanics existing, but on how noticeable and impactful they feel during play.

These changes reflect a shift in design approach toward player-perceived impact, rather than purely numerical balance.

Aspect	Issue	Design insight
Early game pacing	High enemy HP made gameplay slow	Time-to-kill must match intended pacing
Ability balance	Some abilities overpowered, others underwhelming	Player-perceived impact is as important as numerical balance

4.3 Most effective design activities

The survivor game analysis activity was highly effective in shaping the core loop. Observing how similar games use auto-attacks, scaling enemies, and upgrade systems directly informed the structure of movement-focused gameplay and progression.

Additionally, group play testing and feedback discussions were critical. External observation revealed issues such as over reliance on movement; confusion due to unclear hit boxes; lack of engagement without proper feedback (e.g., missing sound); and overpowered abilities. These insights directly drove iterative improvements, demonstrating the importance of testing player behaviour rather than relying solely on design intent.

Activity	Impact
Survivor game analysis	Informed core loop and progression systems
Play testing & feedback	Revealed real player behaviour and usability issues

For more review and reflection documentation refer to the playtesting document.

5. Cycle 3 Preview and Planning: Elemental Allies (Out of Scope for Cycle 2)

In Cycle 3, additional elemental deities will join Logi, each contributing their own upgrade card pool. This expands the build space significantly and adds thematic variety to runs.

Terros (Earth)	Defensive damage-reduction auras.	upgrades: shields, knockback,
Zephyr (Wind)	Mobility projectile homing.	upgrades: dashes, speed boosts,
Voltis (Lightning)	Chain/splash target hits, energy pulses.	upgrades: lightning arcs, multi-

Each elemental ally would appear on the level-up screen in place of Vulcan when offering their respective card types, preserving the visual identity of the upgrade moment. Cross-elemental synergies (e.g. a Wind + Fire combo ability) are a stretch goal for Cycle 3.

5.1 Design Activities

What are your performance goals for cycle 2?

Game communicates with the player well.

Improving the game requires expansion as opposed to culling.

The game is balanced.

The player experiences the PX goals (preferably consistently) throughout the game.

PX goals are Multisensory Engagement and feeling Powerful

How will you judge whether you've met these goals?

Players understand game objectives and believe that significant aspects of the game are easily and clearly visually communicated to them.

The players do not feel overwhelmed by the game

The players do not feel overly frustrated

The players are not disengaged from the game through boredom or ease.

What strategies are you using to achieve these goals?

Initial playtesting (self)

Playtesting (in-class)

Playtest questions address aspects of these specific goals.

Visual observation of playtesters during playtesting

5.2 Initial Triage Table

Issue Description	Severity	Strategy to Address Issue	Other Notes
<i>23/04 Default Playtesting done during game development (group 11)</i>			
<i>Game is too easy (balance issue)</i>	<i>High</i>	<i>Implement a system that slowly increases the difficulty of</i>	<i>This will also allow for more freedom with ability</i>

		<i>enemies as the waves progress.</i>	<i>expansion and upgrading.</i>
<i>Cinder Aura is overpowered</i>	<i>Low</i>	<i>Decrease the damage over time of Cinder Aura to 1 damage every second</i>	<i>This was fixed for later playtesting, but those playtesters said it was then underpowered, try to find balance.</i>
<i>Fire Ring is overpowered</i>	<i>Low</i>	<i>Decrease the damage of the fire ring and make it slower to recharge</i>	<i>This is mainly due to its high damage, which will be affected by the enemy scaling that is to be implemented.</i>
<i>Ember Shot (default ability) becomes too weak as game progresses</i>	<i>Low</i>	<i>Add more upgrades that focus on the basic attack of the player.</i>	<i>5 tier upgrades cycle 3.</i>
<i>Animations and Visual effects for all moving sprites</i>	<i>High</i>	<i>Focus on slowly implementing animations for all sprites that require them, and program the logic behind them.</i>	<i>Cycle 3, refer to GDD</i>
<i>Game Completion is underwhelming</i>	<i>Medium</i>	<i>Add an end screen or end cutscene that ties into the progression of the game.</i>	<i>Added game win screen</i>
<i>Lack of narrative and in game meaning</i>	<i>Low</i>	<i>Add in an introduction and endgame cutscene that explain the events of the game. Add quotes from the deities that</i>	<i>Add cutscene to the first playthrough for narrative setting.</i>

		<i>help the player when they level up.</i>	
--	--	--	--

5.3 Cycle 3 Task Breakdown

Task	Subtask	Role	Person and Time (hrs)	Priority	Notes / Unity Details
Skippable introduction cutscene to help the player understand the events of the game.	Make introduction cutscene slides	Art	Tam Ryan (5)	Mid	Single images faded in and out. Subtitles on screen.
	Implement introduction cutscene music	Sound design	Nick Lachlan (2)	Mid	Background music and voice over.
	Play the cutscene when the player starts the game	Programming	Khoa (3)	Mid	Play the intro once until the game is reopened.
Implement boss attacks and special mechanics.	Add logic to the boss enemy to use more powerful attacks	Programming	Kody (4) Khoa (4)	High	Boss should have 3 skills that it will cycle through. Chomp One Tentacle hit Two Tentacle hit
	Create sprites for the boss enemy's attacks	Art	Ben Ryan (5)	High	
	Create audio for the boss enemy's attacks	Sound design	Lachlan (1)	High	
Player movement animations	Play the animation for the player only when they are moving	Programming	Kody (1)	High	Walk, Hit, Die
	Create the	Art	Tam (3)	High	

	sprites used for the players movement animation				
Player ability animations	Play the animation for when an ability is used	Programming	Khoa Nick (5)	High	Attack
	Create the sprites used for the ability animation	Art	Ben Ryan (5)	High	
Enemy movement animations	Play the animation for the enemies only when they are moving	Programming	Khoa (3)	High	Walk, Hit, Attack, Die
	Create the sprites used for the enemy's movement animation	Art	Tam (5)	High	
Main Menu Music	Find suitable music for the Main Menu	Sound design	Lachlan (1)	Low	War drums
	Implement the music	Sound design	Lachlan (1)	Low	
Wave Progression audio cue	Find a suitable sound effect	Sound design	Lachlan (1)	Low	Menacing level up sound
	Implement the sound effect	Sound design	Nick (1)	Low	
Game music that increases in intensity as	Find music that suits each stage of the game	Sound design	Lachlan (1)	Mid	Increase bpm and dynamic contrast

the game progresses	Switch music at different stages of the game	Programming	Kody (2)	Mid	
Implement earth, wind, and lightning based abilities	Program the functionality the earth abilities	Programming	Nick (2)	High	Shield / wall Knockback
	Make sprites for each of the earth abilities	Art	Ben (4)	High	
	Find sound effects for each of the earth abilities	Sound design	Lachlan (2)	High	
	Program the functionality the wind abilities	Programming	Nick (2)	High	Dash Speed boost (movement)
	Make sprites for each of the wind abilities	Art	Ben (4)	High	
	Find sound effects for each of the wind abilities	Sound design	Ryan (1)	High	
	Program the functionality the lightning abilities	Programming	Nick (2)	Medium	Chain lightning (connects / damages nearby enemies) Energy pulses
	Make sprites for each of the lightning abilities	Art	Tam (4)	Medium	

	Find sound effects for each of the lightning abilities	Sound design	Ryan (1)	Medium	
Scaling enemies with levels/waves	Set logic that scales the enemies health and damage based on the current wave	Programming	Khoa (2)	High	To add difficulty to later stages
	Set logic that scales the enemies health and damage based on the player's level	Programming	Khoa (2)	Mid	
Options screen completion	Add options / controls to the Options UI in the main menu.	Programming	Kody Lachlan (4)	High	Update this screen with the required information Volume Controls
Refinement of Ability Card visuals	Update and improve ability card visuals.	Art	Ben (3)	Mid	Match / replicate in game ability animation / sprites.
Ability Information Screen	Add in the Main Menu.	Art	Ben (2)	High	Shows all available abilities and upgrades and has specific detailed outlines of their effects and actions.
Upgrade Background	Have obstacles, hazards and buffs littered throughout the map.	Programming	Kody (4)	Mid	Lava / water pools Totems / statues Additional themed ones for additional abilities (earth, wind, lightning)
	Add more detailed	Art	Tam (2)	High	

	and interesting environmental sprites / objects to the map.				
Enemy Status	Add status sprites to enemies to show the player how close to death they are.	Programming	Kody (2)	Mid	Decaying / injured sprite levels
		Art	Tam Ryan (4)	Mid	

5.4 Approach to Team Communication

During this cycle the team has met twice a week during the studios and during the practicals. We have also kept in constant touch over a personal IGB100 discord server. Every week we set goals in the studio to be accomplished in the following practical and during free time in the week to come. Each member constantly updated the discord as they progressed, both as a proof of work and to ensure that there were no push conflicts with Github. The group used Github to manage the game's files, and shared word and google documents for the design document, task breakdown, and playtesting report.

As we move forward, most of this will remain the same. Additionally, on weekends each member will submit their scrum presentation slides to Kody, the Scrum Leader, who will compile them into a powerpoint to present on Tuesday. These Scrums will also act as an additional way for each member to organise their current tasks for the week to better remain organised and on task.

We have used Github for version (Unity 6000.3.13f1) control with this project. Additionally we used both Trello and Google Sheets for task allocation throughout the cycle.

6. Screenshots from the Final Game

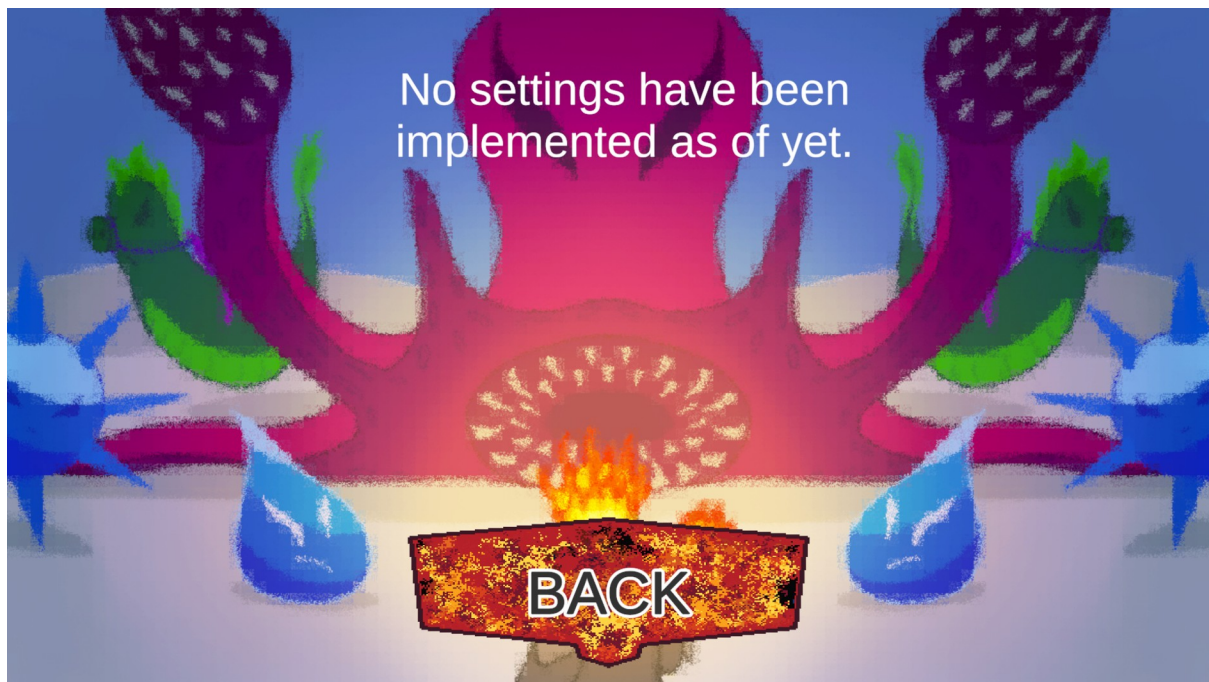

6.1 Main Menu Screen

6.2 Help Screen

	Movement	In War on Water, you play as an emissary to the Kingdom of Fire, tasked with defeating The Octoboss. You must move around the screen in order to evade the ever increasing swarms of water elementals to survive. You will automatically attack enemies that are close, and can collect embers from defeated enemies to grow stronger. Upon leveling up, you must choose one of three abilities that appear. After 10 waves have passed, the water elementals will have had enough and The Octoboss will appear and try to finish you off. During the game, if you fail to defeat all enemies before the wave timer runs out, they will cross over and make your next wave more difficult.
